Introduction to C Programming Moaml
Mohammed,2019-09-05 Introduction to C Programming This textbook was written with two primary objectives The first is to introduce the C programming language C is a practical and still current software tool it remains one of the most popular programming languages in existence particularly in areas such as embedded systems C facilitates writing code that is very efficient and powerful and given the ubiquity of C compilers can be easily ported to many different platforms Also there is an enormous code base of C programs developed over the last 30 years and many systems that will need to be maintained and extended for many years to come The second key objective is to introduce the basic concepts of software design At one level this is C specific to learn to design code and debug complete C programs At another level it is more general to learn the necessary skills to design large and complex software systems This involves learning to decompose large problems into manageable systems of modules to use modularity and clean interfaces to design for correctness clarity and flexibility C is a general purpose programming language and is used for writing programs in many different domains such as operating systems numerical computing graphical applications etc It is a small language with just 32 keywords see HS95 page 23 It provides high level structured programming constructs such as statement grouping decision making and looping as well as low level capabilities such as the ability to manipulate bytes and addresses Since C is relatively small it can be described in a small space and learned quickly A programmer can reasonably expect to know and understand and indeed regularly use the entire language KR88 page 2 C achieves its compact size by providing spartan services within the language proper foregoing many of the higher level features commonly built in to other languages For example C provides no operations to deal directly with composite objects such as lists or arrays There are no memory management facilities apart from static definition and stack allocation of local variables And there are no input output facilities such as for printing to the screen or writing to a file Much of the functionality of C is provided by way of software routines called functions The language is accompanied by a standard library of functions that provide a collection of commonly used operations For example the standard function printf prints text to the screen or more precisely to standard output which is typically the screen The standard library will be used extensively throughout this text it is important to avoid writing your own code when a correct and portable implementation already exists
