Lesson Summary

Plant Tissue Systems

Key Questions What are the three tissue systems of plants?

The body plans and structures of plants are adaptations that help them survive in their environments.

Dermal, Vascular, and Ground Tissue All plants are composed of three tissue systems: dermal, vascular, and ground tissue. Dermal tissue is the outer protective layer of cells that covers and protects the plant. Vascular tissue is the system of tubes that carries water and nutrients throughout the plant. Ground tissue is the tissue between dermal and vascular tissue that carries out photosynthesis, storage, and support.

Plant Tissues and Growth Plant tissues respond to **stimuli** in the environment, such as light, water, and gravity. Plants grow in response to these stimuli. Tissues that are necessary for growth are called **meristems**.

Monocots and Dicots Flowering plants can be classified as either monocots or dicots. Monocots have one cotyledon, or seed leaf, and dicots have two. Monocots and dicots also have different vascular tissue arrangements.

Key Vocabulary

meristem tissue made of undifferentiated cells that are capable of rapidly dividing to produce new cells

stimulus (plural *stimuli*) anything in the environment that causes a response in an organism
