

11. Linear Programming

- Problems which seek to maximise (or minimise) a function subject to certain constraints are called optimisation problems.
- A Linear Programming Problem (L.P.P.) is the one that is concerned with finding the optimal value (maximum or minimum value) of a linear function of several variables (called objective function), subject to the conditions that the variables are non-negative and satisfy a set of linear inequalities (called constraints). The variables are sometimes called the decision variables.

For example: The following is an L.P.P.

$$\text{Maximize } Z = 10x + 12y$$

Subject to the following constraints:

$$5x + 3y \leq 30 \quad \dots (1)$$

$$x + 2y \geq 2 \quad \dots (2)$$

$$x \geq 0, y \geq 0 \quad \dots (3)$$

In this L.P.P, the objective function is $Z = 10x + 12y$

The inequalities (1), (2), and (3) are called constraints.

- The common region determined by all the constraints including the non-negative constraints $x \geq 0, y \geq 0$ of a linear programming problem is called the feasible region (or solution region) for the problem. The region outside this feasible region is called infeasible region.
- Points within and on the boundary of the feasible region represent feasible solutions of the constraints. Any point outside the feasible region is an infeasible solution.
- Any point in the feasible region that gives the optimal value (maximum or minimum) of the objective function is called an optimal solution.

• Fundamental Theorems for Solving Linear Programming Problems:

Theorem 1: Let R be the feasible region for a linear programming problem and let $Z = ax + by$ be the objective function. When Z has an optimal value, where the variables x and y are subject to constraints described by linear inequalities, this optimal value must occur at a corner point of the feasible region.

Theorem 2: Let R be the feasible region for a linear programming problem, and let $Z = ax + by$ be the objective function. If R is bounded, then the objective function Z has both a maximum and a minimum value on R and each of these occurs at a corner point of R .

Example: Minimise and Maximise $Z = 35x + 45y$

Subject to constraints

$$x + 2y \geq 12 \quad \dots (1)$$

$$2x + y \geq 12 \quad \dots (2)$$

$$x + y \leq 10 \quad \dots (3)$$
