

Standard Chemical Thermodynamic Properties

This table lists standard enthalpies of formation ΔH_f° , standard third-law entropies S° , standard free energies of formation ΔG_f° , and molar heat capacities at constant pressure, c_p , for a variety of substances, all at 25°C (298.15 K) and 1 atm. The table proceeds from the left side to the right side of the periodic table. Binary compounds are listed under the element that occurs to the left in the periodic table, except that binary oxides and hydrides are listed with the other element. Thus, KCl is listed with potassium and its compounds, but ClO_2 is listed with chlorine and its compounds.

Note that the solution-phase entropies are not absolute entropies but are measured relative to the arbitrary standard $S^\circ(\text{H}^+(\text{aq})) = 0$. Consequently, some of them (as well as some of the heat capacities) are negative.

Most of the thermodynamic data in these tables were taken from the NBS *Tables of Chemical Thermodynamic Properties* (1982) and changed, where necessary, from a standard pressure of 0.1 MPa to 1 atm. The data for organic compounds C_nH_m ($n > 2$) were taken from the *Handbook of Chemistry and Physics* (1981).
