Zegzhda,2009-05-27 A general approach to the derivation of equations of motion of as holonomic as nonholonomic systems with the constraints of any order is suggested The system of equations of motion in the generalized coordinates is regarded as a one vector relation represented in a space tangential to a manifold of all possible positions of system at given instant The tangential space is partitioned by the equations of constraints

into two orthogonal subspaces In one of them for the constraints up to the second order the motion law is given by the equations of constraints and in the other one for ideal constraints it is described by the vector equation without reactions of connections In the whole space the motion law involves Lagrangian multipliers It is shown that for the holonomic and nonholonomic constraints up to the second order these multipliers can be found as the function of time positions of system and its velocities The application of Lagrangian multipliers for holonomic systems permits us to construct a new method for determining the eigenfrequencies and eigenforms of oscillations of elastic systems and also to suggest a special form of equations for describing the system of motion of rigid bodies The nonholonomic constraints the order of which is greater than two are regarded as programming constraints such that their validity is provided due to the existence of generalized control forces which are determined as the functions of time The closed system of differential equations which makes it possible to find as these control forces as the generalized Lagrange coordinates is compound The theory suggested is illustrated by the examples of a spacecraft motion The book is primarily addressed to specialists in analytic mechanics
