9. Order the slopes for decreasing to increasing of each feature 1-4.

- 1. Place the intercept point at the origin and use slope rules consistently repeated with labels indicating all intersections of each line.
- 2. Place the intercept point at each coordinate intercept following consistent markers of each line.
- 3. With each drawing, the resulting picture then compare points of each drawn set with labeled line points. Always label axes, intersections, and slopes.
- 4. Mark points of each set consistently on drawn graph with consistent labels.

Practical Channel Hydraulics, 2nd edition Donald W. Knight,Caroline Hazlewood,Rob Lamb,Paul G. Samuels,Koji Shiono,2018-03-05 Practical Channel Hydraulics is a technical guide for estimating flood water levels in rivers using the innovative software known as the Conveyance and Afflux Estimation System CES AES The stand alone software is freely available at HR Wallingford s website www.riverconveyance.net The conveyance engine has also been embedded within industry standard river modelling software such as InfoWorks RS and Flood Modeller Pro This 2nd Edition has been greatly expanded through the addition of Chapters 6 8 which now supply the background to the Shiono and Knight Method SKM upon which the CES AES is largely based With the need to estimate river levels more accurately computational methods are now frequently embedded in flood risk management procedures as

for example in ISO 18320 Determination of the stage discharge relationship in which both the SKM and CES feature The CES AES incorporates five main components A Roughness Adviser A Conveyance Generator an Uncertainty Estimator a Backwater Module and an Afflux Estimator The SKM provides an alternative approach solving the governing equation analytically or numerically using Excel or with the short FORTRAN program provided Special attention is paid to calculating the distributions of boundary shear stress distributions in channels of different shape and to appropriate formulations for resistance and drag forces including those on trees in floodplains Worked examples are given for flows in a wide range of channel types size shape cover sinuosity ranging from small scale laboratory flumes $Q = 2.0 \text{ l/s}$ to European rivers $2000 \text{ m}^3/\text{s}$ and large scale world rivers $23000 \text{ m}^3/\text{s}$ a 10^7 range in discharge Sites from rivers in the UK France China New Zealand and Ecuador are considered Topics are introduced initially at a simplified level and get progressively more complex in later chapters This book is intended for post graduate level students and practising engineers or hydrologists engaged in flood risk management as well as those who may simply just wish to learn more about modelling flows in rivers
