□, 2003-11-20      **Biology of Ticks Volume 2** Daniel E. Sonenshine, R. Michael Roe, 2014 Spanning two volumes this is the  
most comprehensive work on tick biology and tick borne diseases      **Regulation of immune system cell functions by  
protein kinase C** Noah Isakov, Amnon Altman, 2014-11-11 Members of the protein kinase C PKC family of Ser Thr kinases  
are encoded by nine distinct but closely related genes which give rise to more than 12 different protein isoforms via a  
mechanism of alternative RNA splicing Most PKC proteins are ubiquitously expressed and participate in a plethora of  
functions in most cell types A majority of PKC isoforms is also expressed in cells of the immune system in which they are  
involved in signal transduction downstream of a range of surface receptors including the antigen receptors on T and B  
lymphocytes PKC proteins are central to signal initiation and propagation and to the regulation of processes leading to  
immune cell proliferation differentiation homing and survival As a result PKC proteins directly impact on the quality and  
quantity of immune responses and indirectly on the host resistance to pathogens and tendency to develop immune  
deficiencies and autoimmune diseases A significant progress was made in recent years in understanding the regulation of  
PKC enzymes their mechanism of action and their role in determining immunocyte behavior This volume reviews the most  
significant contributions made in the field of immune cell regulation by PKC enzymes Several manuscripts are devoted to the  
role of distinct PKC isoforms in the regulation of selected immunocyte responses Additional manuscripts review more general  
mechanisms of regulation of PKC enzymes either by post translational modifications such as phosphorylation or controlled  
proteolysis or by interaction with different binding proteins that may alter the conformation activity and subcellular location  
of PKC Both types of mechanisms can introduce conformational changes in the molecule which may affect its ability to  
interact with cofactors ATP or substrates This topic will be followed by a discussion on the positive and negative impact of  
individual PKC isoforms on cell cycle regulation A second section of this volume concentrates on selected topics relevant to  
role of the novel PKC isoform PKC theta in T lymphocyte function PKC theta plays important and some non redundant roles in  
T cell activation and is a key isoform that recruits to the immunological synapse the surface membrane area in T cells that  
comes in direct contact with antigen presenting cells The immunological synapse is formed in T cells within seconds  
following the engagement of the TCR by a peptide bound MHC molecule on the surface of antigen presenting cells It serves  
as a platform for receptors adaptor proteins and effector molecules which assemble into multimolecular activation complexes  
required for signal transduction The unique ability of PKC theta to activate the NF kB AP 1 and NF AT transcription factors is  
well established and recent studies contributed essential information on the mechanisms involved in the recruitment of PKC  
theta to the center of the immunological synapse and the nature of its substrates and the role of their phosphorylated forms  
in signal transduction Additional review manuscripts will describe the unique behavior of PKC theta in regulatory T cells and  
its role in the regulation of other cell populations including those of the innate immune response This volume brings together

leading experts from different disciplines that review the most recent discoveries and offer new perspectives on the contributions of PKC isoforms to biochemical processes and signaling events in different immune cell populations and their impact on the overall host immune response
