

CHROMOSOMES

DESCRIPTION

A chromosome is a molecule of DNA that is supercoiled around proteins so it can fit into the nucleus of a cell. In humans, the DNA of a single Chromosome ranges between 14 and 73 nm in length.

All eukaryotic chromosomes consist of three distinct regions: the **telomeres** (tips of the chromosome), the **centromere** (the constricted region of the chromosome), and several hundred to several thousand genes found along the "body" of the chromosome.

<https://www.youtube.com/watch?v=gbSIBhFwQ4s&t=74s> Accessed: 5/5/21

Study this picture for the DNA packaging in chromosomes.

Figure 1: Chromosomes are composed of DNA tightly-wound around histones. Chromosomal DNA is packaged inside microscopic nuclei with the help of histones. These are positively-charged proteins that strongly adhere to negatively-charged DNA and form complexes called nucleosomes. Each nucleosome is composed of DNA, wound 1.65 times around eight histone proteins. Nucleosomes fold up to form a 30-nanometer chromatin fiber, which forms loops averaging 300 nanometers in length. The 300 nm fibers are compressed and folded to produce a 250 nm-wide fiber, which is tightly coiled into the chromosome of a chromosome.

Humans have 46 chromosomes (or 23 pairs) arranged by size. Use the following link to learn about the size and number of genes on the largest and smallest human chromosomes:
