Critical Issues in User Interface Systems Engineering David Benyon, Philippe Palanque, 2012-12-06 This book developed from an IFIP workshop which brought together methods and architecture researchers in Human Computer Interaction and Software Engineering To an extent this introduction is a little unfair to the authors as we have distilled the results of the workshop to give the reader a perspective of the problems within integrated approaches to usability engineering The papers could not hope to address all of the issues however we hope that a framework will help the reader gain further insights into current research and future practice The initial motivation was to bring together researchers and practitioners to exchange their experiences on Graphical User Interface design problems The two groups represented methodological and architecture tools interests so the workshop focused on intersection of how methods can support user interface development and vice versa how tools architectures and reusable components can empower the design process There is we believe a constructive tension between these two communities Methodologists tend to approach the design problem with task domain organisational analysis while the tool builders suggest design empowerment envisioning as a means of improving the way users work rather than relying on analysis of current systems This debate revolves around the questions of whether users current work is optimal or whether designers have the insight to empower users by creating effective solutions to their problems Tool builders typically want to build something then get the users to try it while the methodologists want to specify something validate it and then build it
