

# LINKAGE MAPPING

**Linkage** is the tendency of DNA sequences that are close together on a chromosome to be inherited together during the meiosis phase of sexual reproduction.

A **linkage map** depicts the order of genetic markers and the relative distances between them as measured in terms of **recombination frequencies** between the markers.

- The greater the frequency of recombination (segregation) between two genetic markers, the further apart they are assumed to be.
- Conversely, the lower the frequency of recombination between the markers, the smaller the physical distance between them.
- Historically, the markers originally used were detectable phenotypes (enzyme production, eye colour) derived from coding DNA sequences.
- Eventually, confirmed or assumed noncoding DNA sequences such as microsatellites or those generating RFLPs have been used.
